

Click → Background Auto-Update (Honest)

EMS pack v0.1.6 · Agent 1.1.5 · branch desktop+agent · docs 2026-09-20

What ships today vs what is still ops / signing.

Short answer

YES — click-to-background update exists (Phase E MVP) for **Manager Desktop v0.1.6** and **Agent v1.1.5**. It is **not** silent force-update without user click. User sees “Update available” → clicks → download + install runs in background → app relaunches.

Does it wipe data / sensitive info?

Layer	Touched?	Safe by design?
Server ems.db / screenshots / invoices	Never	Yes — update is local PC only
Agent config.json (enroll token)	Preserved (XF)	Yes if robocopy path used
Agent agent_data / outbox	Preserved (no mirror delete)	Yes
Manager local settings	Installer currentUser	Yes — no server wipe

Security posture (honest risk)

- **Safe enough for office** when downloads are HTTPS on ems.cfsdesigners.com and Tauri/Agent host-allowlist blocks other hosts.
- **Not** full big-tech signed updater yet (Authenticode / Tauri plugin-updater keys) — that is docs/64 optional next.
- Risk if someone MITMs DNS and you somehow bypass HTTPS: mitigated by TLS + allowlist. Do not point Agents at HTTP.
- First office install of this version is still manual once; later bumps use the banner.

Client install → later updates

- Day 0: Admin installs Manager Setup + gives staff Agent zip.
- Day N: bump versions on VPS + upload new binaries → enrolled apps show banner.
- User clicks Update → background install → relaunch. No DB wipe. No screenshot delete.

Verdict: **Not risky for server/client data** if you follow the preserve-config design. Remaining risk is binary authenticity until code-signing keys are added.
